AI Projects Meeting

Invited levi.young@contourinteriors.com.au Al-khair Pama

Attachments AI Projects Meeting

Meeting records Transcript

Summary

HubSpot architecture review and lead research tool planning via Claude integration.

HubSpot And Claude Architecture
HubSpot workflows combined with Claude enabled automated AI projects. Digital Ocean deployed the back end.

Lead Research Tool Parameters
Research model targeted office relocations in Melbourne, Adelaide, or Perth. Parameters required 1,000 square meters plus.

Project Prioritization And Access
Research and trigger workflow became the primary focus. HubSpot write access and Claude API access were requested.

Decisions

Aligned

- **Adoption of custom Claude-driven search engine** The participants aligned on building a custom back-end research engine powered by Claude instead of using HubSpot's built-in AI.

- **Integration of quantitative lead scoring parameters** The team agreed to incorporate quantitative data and ranking parameters into the automated company research tool to score leads.
- **Prioritization of automated company research project** The participants agreed to prioritize the automated research model project and temporarily put the meeting prep workflow on hold.

Next steps

- ☐ [Al-khair Pama] Email Setup Requirements: Draft and send an email listing the technical requirements for upcoming projects, specifically including HubSpot access levels and Claude API integration details.
- ☐ [Levi Young] Grant HubSpot Access: Grant administrative access to HubSpot to enable the development of automated workflows.
- ☐ [Levi Young] Enable Claude API: Complete the setup of the Claude API service to allow for its integration into the automated research model.
- ☐ [Al-khair Pama] Develop Research Model: Develop a research tool that identifies companies meeting specific industry, size, and trigger event criteria to generate a weekly list of qualified leads.

Details

HubSpot Platform and Workflow Architecture: Al-khair Pama presented the HubSpot setup for automated AI projects, addressing the problem of navigating multiple platforms by recommending the use of built-in HubSpot workflows (00:00:02). For the underlying artificial intelligence, Al-khair Pama and Levi Young discussed utilizing Claude instead of HubSpot built-in AI (Breeze), because HubSpot AI lacks deep research capabilities and control, whereas Claude can be tailored to specific project needs (00:02:56). Additionally, Al-khair Pama mentioned deploying the back end using Digital Ocean as an infrastructure-as-a-service platform (00:01:20). Levi Young confirmed understanding that they would build a search engine backed by

Claude and multiple applications (00:04:23).

Lead Research and Trigger Events Project Focus: Levi Young proposed shifting focus to the second project involving trigger events and reviewing leads for follow-up (00:05:18). Levi Young outlined the problem of needing a tool that constantly conducts extensive research to identify companies experiencing significant growth, specific sizes, industries, or events indicating a need for a new office (00:06:28). While Al-khair Pama suggested utilizing existing companies in HubSpot as a baseline, Levi Young clarified that HubSpot data lacks information on recent trigger events, necessitating broader external research (00:07:47). Levi Young requested that Al-khair Pama compile questions regarding data points and criteria needed to build the research model (00:09:00).

Analytics and Data Integration for Research Parameters: Al-khair Pama proposed performing statistical analysis on HubSpot analytics data to derive insightful parameters and quantitative data for scoring opportunities within the research model (00:10:03) (00:12:35). Levi Young clarified that contact frequency in HubSpot does not correlate with project likelihood, as large office design fit projects only occur once every five to ten years per company, meaning HubSpot analytics data on frequent contacts is not relevant for project prediction (00:13:33). Al-khair Pama acknowledged this clarification and agreed to coordinate directly with Levi Young regarding any questions (00:14:41).

Scope and Parameters of the Research Tool: Levi Young detailed the ultimate endgame and scope of the research tool, which involves scanning multiple industries and triggers for office relocations and design-and-build projects (00:15:36). Levi Young specified that target projects are typically 1,000 square meters plus with 100 plus staff located in Melbourne, Adelaide, or Perth. Project triggers identified by Levi Young include lease expirations, corporate mergers involving older offices, or newly awarded major contracts requiring 100 additional corporate office workers (00:16:45). Al-khair Pama confirmed understanding of these clear parameters (00:17:53).

Technical Setup and Access Requirements: Al-khair Pama outlined necessary

technical setup requirements to build the model, requesting HubSpot write access instead of view-only access, and Claude API access and organization membership. Levi Young agreed to sort out the HubSpot access and requested that Al-khair Pama send an email detailing the Claude API breakdown so the office can set it up. Al-khair Pama noted plans to work on the model over the weekend (00:18:55).

Project Prioritization: Al-khair Pama and Levi Young discussed project prioritization, deciding to shift focus entirely to the research and trigger workflow project while putting the meeting prep deal workflow on hold (00:20:34). Levi Young confirmed that getting the weekly research lead generation tool running is the key priority. Al-khair Pama agreed to prioritize the research model and dive into the setup (00:21:33).

Weekend Work and Tracking Software Inquiries: Al-khair Pama raised a question about logging into the Nexus system during weekend work and whether it would be counted as overtime (00:23:48). Al-khair Pama expressed privacy concerns regarding activity tracking features in the Nexus software (00:26:36). Levi Young stated they would check with Nexus regarding overtime policies and engagement limits, noting that unnecessary overtime rates would not be expected (00:23:48). Levi Young and Al-khair Pama agreed that the Nexus tracking software monitors device activity rather than personal content or screen viewing (00:26:36).

You should review Gemini's notes to make sure they're accurate. Get tips and learn how Gemini takes notes
